Subject: Public Comment to GLWA Board Meeting on March 27, 2019
Date: Sunday, March 24, 2019 7:49:37 PM

The current issue of Journal of Great Lakes Research reports that GLWA discharge to Lake Erie had reduced phosphorus from 630 MTA in 2007 to 331 MTA in 2016. This would be great if it was true. The claimed reduction is due to faulty testing and analysis permitted by inept NPDES permit, which now will be renewed with stricter requirements as we push for them. By the way, GLWA data was supplied to researchers by GLWA personnel. GLWA discharge of phosphorus to Lake Erie remains a very great problem. The problem can be solved by tertiary treatment.
