PROJECT INFORMATION

Scope of Work: The work to be completed under this project will include installing ventilation and atmospheric control for the pipe gallery; providing new lights and emergency lights, etc.. This work also includes rehabilitation of 12 drain lines from rectangular clarifiers 3-12, circular clarifiers 16 and 16, installation of large manhole with sump pumps to collect drainage and discharge to clarifier, and concrete crack repairs, and rehabilitation work in Electrical/Mechanical Building.

Describe Here the Changes from the 2018 CIP to 2019 CIP

Engineering Services contract will be extended to match the construction schedule. The original project called out for the replacement of only 2 of the 8 magnetic flow meters at pump station no. 2 (PC-795). Operations and Maintenance have indicated that the remaining 6 meters have either failed or are failing. Since we have a contractor mobilized for the work pertaining to replacement of 2 of these devices it makes sense to have them replace the remaining while under contract.

PROJECT INFORMATION

Scope of Work: The preliminary scope of this project is to provide basis of design (study) report for rehabilitation/rebuilding plan for existing pump and its control and any associated equipment. The study will look into the addition of VFD to the three constant speed pumps. The study will not be limited to increasing the capacity of existing pumps to meet the long-term goal for wet weather capacity. The Scope also include: Provide engineering design for rehabilitation/rebuilding of the pumps, replacement of HVAC System, I&C Improvements (i.e. automation, etc.), structural, architectural and electrical improvement, provide design for any recommendation made by the study report. The services during construction is: provide construction assistance, such as review of shop drawings, response to RFIs, attending progress meetings, verifying and assisting GLWA for any changes requested by the contractor, etc.

Construction will follow after the completion of design.

Project History: Pump Station No. 2 was built in 1994. Seven out of eight pumps were running since 1994. These pumps never attained the design capacity due to an unidentified drifting problem. The eighth pump (Pump No. 10) was installed under PC-740 with a modified suction elbow that provided better pumping capacity. The VFDs for five (5) pumps were also replaced in 2005 under PC-744 contract. A new impeller was installed on Pump No. 9 and a rebuilt impeller was installed on Pump No. 16 in 2008, which provided sufficient improvements

WRRF PS No. 2 Improvements Phase II

Old CIP# 1287

in pumping capacity. To mitigate the declining of pumping capacity, DWSD initiated a CS-1444/PC-795 PS-2 Pumping Improvements project to rehabilitate Pump No. 11 and Pump No. 14 to solidify the long-term wet weather capacity of 1700 MGD.

It was recommended to rehabilitate the remaining pumps with energy efficient, and more reliable control systems that require less maintenance.

Driver: 2 - Performance

Challenges: Shutdowns of the pumps to be rehabilitated will require co-ordination with operations and careful planning to meet NPDES permit requirements for the flow capacity during the construction phase.

Other Important Info: n/a

Related Project: The work shall start in accordance with the completion of PC-795, PS-2 Pumping Improvements and Rehabilitation of Pump Station No. 2 Rack and Grit Improvements.

PROJECT INFORMATION

Project Engineer/Manager: Beena Chackunkal

Managing Dept WW Eng

Title: Engineer

Manager: Ali Khraizat

Phone: (313) 297-9825

Email: Beena.Chackunkal@glwater.or

Scope of Work: The work consists of evaluation, design and construction for the replacement of Bar Racks and Grit Collection System including their associated motors and electrical panels as necessary to meet the long-term wet weather capacity requirements at the PS-2.

Project History: The Pump Station No. 2 Rack and Grit Collection system have been in service for almost twenty years. The equipment are near the end of its useful life. Improper transport of collected screenings has been ongoing problem and rags and other floatable materials are not screened thoroughly.

The condition and reliability of the Pump Station No. 2 Grit System was inspected and the grit crane was upgraded in 2002 by PC-744/DWP-1006. The HVAC system was found in good condition but needs some rehabilitation due to its ending life cycle.

Project Classification Level 2: WRRF

Project Classification Level 3: Primary Treatment

Project Location: City of Detroit

Fund: 5421 Cost Center: 892211

Image: Modifications are needed to the existing Grit removal system because of the draining issues. Grit Chambers cannot be emptied due to clogged drains.

2 Grit carry over cause deterioration of the downstream process and equipment

² Rehabilitation/Replacement of screening belt since the equipment is nearing to its useful life.

WRRF PS #2 Bar Racks Replacements and Grit Collection System Improvements

Old CIP# 1314

Pressure Rehabilitation of Grit Channel Drain Gate stems.

The bar screen foundations, screen frames, and conveyance chutes in PS-2 have been in service for approximately twenty years.

Driver: 2 - Performance

Challenges: Maintaining the MDEQ-NPDES required capacity during the construction phase of the project.

Other Important Info: *Innovation note: Include new grit removal equpment rather than replacement in kind (cyclonic).

The CIP Project Proposal – CIP 1314 – "Replacement of Bar Racks at Pump Station No. 2" and CIP Project Proposal – CIP 1223 – "Rehabilitation of Grit and Screening System at PS-2 and Rehabilitation of Sampling Sites at WWTP" are combined into one project under CIP 1314. That combined new budget for CIP 1314 (CIP 1223 and 1314) has a total amount of \$11,617,000. The design of "Rehabilitation of Sampling Sites" is completed and will be bid separately for construction. The previous design for Bar Rack System by Sigma under As Needed Engineering Services Contact task order will not proceed for construction as designed. An engineering decision to have a fresh look and start new study, design and construction project through this CIP project will proceed. The original budget for CIP-1314 is \$3.667M. The \$6.0M CIP budget transfer was made from CIP-1223. The new revised CIP-1314 budget is \$9.667

PROJECT SUMMARY	 Innovation MP Right Sizing System Reliability 	Project Status Future Planned	Project Status Guide: Active: One or more phases have started, i New: First appearance in CIP Future Planned: No Phases have Started Cancelled-Closed: All Phases Have Officially Pending Closeout: Project at Substantial Co Archived: Project closed or completed for r Reclassified: Projects that have been merge	Closed or Project Cancelled mpletion but not closed out nore than one year

Project Title WRRF Rehabilitation of Ferric Chloride Feed System in PS-1 and Complex B Sludge Lines

Project Significance The Ferric Chloride Systems at PS-1 is used to reduce phosphorus to the required permit levels. The system, which include chemical storage tanks, secondary containment, valves and piping is in need of rehabilitation. The Complex B sludge lines are clogged due to Struvite and need rehabilitation/replacement.

PROJECT INFORMATION

- Scope of Work: The scope of work will include study design and construction for the ferric chloride feed system at PS-1. Specifically it will include: a study to evaluate alternative locations for application of ferric chloride, a pilot study to test alternative application points, and inspection of the existing chemical feed systems, a study to provide recommendations for system modifications and improvements, design of recommended system improvements, and construction of chemical feed system improvements. Evaluation and recommended design and construction of the sludge lines in Complex B is also included in the scope.
- Project History: There are phosphorous effluent permit limits for both primary effluent (during wet weather) and for secondary effluent. Effluent limits for phosphorous were lowered again in 2016 and now stand at 1.5 mg/l for primary effluent and 0.7 mg/l (October March) and 0.6 mg/l (April September) for secondary effluent. GLWA has historically been able to meet the phosphorous limits for both primary and secondary effluent by adding ferric chloride to the primary clarifier influent. The physical/chemical removal in the primary clarifiers lowered the phosphorous concentrations to meet the primary effluent limits. However, GLWA has begun to experience some difficulty with the settling of the secondary biomass in the final clarifiers. Preliminary investigations have indicated that this settling ability issue could be caused by low phosphorous

WRRF Rehabilitation of Ferric Chloride Feed System in PS-1 and Complex B Sludge Lines

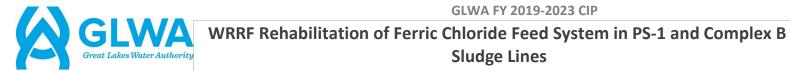

Old CIP# 1382

concentrations in the secondary influent wastewater. This is because the biomass in the secondary system requires a certain ratio of carbon (CBOD), nitrogen, and phosphorous to reduce the pollutant concentrations and then settle in the final clarifiers. As such, in addition to rehabilitating the ferric chloride system at PS-1, there also needs to be a study and possibly pilot test conducted to review the best location for ferric chloride addition to the wastewater.

Driver: 1 - Condition

- Challenges: Maintaining capacity of the existing feed system during construction will be a challenge. Also, determining the simplest system that will meet current and future phosphorous limits for both primary and secondary effluent will be a challenge.
- Other Important Info: *Innovation note: Align sizing & design with U of M phosphorus & enhanced carbon capture studies, as well as improved mixing of the ferric with primary influent.

Related Project: Rehabilitation of Pump Station – 2 Ferric Chloride Feed System is currently in design stage and construction will start soon.

CIP 211009: Rehabilitation of the Circular Primary Clarifier Scum Removal System

Project Significance The circular clarifiers scum removal system is over 10 years old and need to be rehabilitated. They will help protect the secondary treatment process by preventing scum from entering the aeration tanks.

Year Added: 2017 **CIP Type:** Project Date Original BCE Prepared: 7/27/2016 **Budget:** Wastewater Project Classification Level 1: Wastewater Date BCE Last Updated: 9/15/2017 Project Classification Level 2: WRRF Project Engineer/Manager: Ali Khraizat **Project Classification Level 3: Primary Treatment** Title: Manager **Project Location:** City of Detroit Phone: (313) 297-8819 **Email:** ali.khraizat@glwater.org Fund: 5421 Manager: Ali Khraizat Cost Center: 892211 Managing Dept WW Eng

PROJECT INFORMATION

- Scope of Work: This project will provide for the study, design and construction of new scum equipment in the Scum Buildings for the circular clarifiers. The study will consist of an evaluation of the existing process and simplified alternative systems for scum removal including the scum removal from the buildings. Future alternatives for scum disposal, such as addition to an anaerobic digestion process, will be considered. All alternatives will be evaluated for energy efficiency (reduction of electrical usage). The scum removal system at the rectangular PCs will also be evaluated to determine which aspects can be applied to the circular SBs. Design and construction services will be included for the selected scum removal system.
- Project History: There are 12 rectangular PCs (1-12) and 6 circular PCs (13-18) clarifiers at the WRRF. PCs remove TSS, BOD, and phosphorous through a chemically enhanced settling process. The clarifiers also remove fats, oils, and grease (FOG or scum) by skimming the surface of the clarifiers and transporting the scum to a SB where it can be concentrated and pumped again to be hauled off site. The SBs for the rectangular clarifiers were recently rehabilitated. They have a fairly simple system and appear to be operating well. The SBs for the circular clarifiers utilize a somewhat complex transport and concentration system. New SBs were installed for PCs 17 and 18 when they were constructed. Since their installation, the equipment in the circular clarifier SBs has been complicated to operate and difficult to maintain. Much of the equipment is out of service for

WRRF Rehabilitation of the Circular Primary Clarifier Scum Removal System

Old CIP# 1386

extended periods of time.

Driver: 1 - Condition

Challenges: Each of the scum removal facility serves two circular clarifiers, so two circular clarifiers at a given time needs to be out of services during rehabilitation, this will limit the primary capacity to minimum to meet NPDES permit requirements.

Other Important Info: *Innovation note: See project write-up -- evaluate alternatives for energy efficiency.

Related Project: This project will need to be closely coordinated with other ongoing PC rehabilitation projects. Especially PC-757 which will be limiting primary capacity due to taking multiple primary clarifiers out of service for rehabilitation.

PROJECT INFORMATION

Scope of Work: This project provides new power supply cable to/from secondary clarifiers and substation MCC, provides new MCCs at each secondary clarifier, provides short-circuit analysis and fault rating, replace 25 RAS pumps at the secondary clarifiers and complete all miscellaneous electrical work such as replacement of cables, conduit, pull boxes, panels and junctions boxes, etc.

CIP 212004: Replacement of Chlorination and Dechlorination Equipment at the WRRF

Project Significance The disinfection complex equipment condition has deteriorated because of the corrosive characteristics of the chemicals utilized in the operations of the area. This project is needed to restore equipment performance to OEM levels.

Year Added:	2010	CIP Type: Project
Date Original BCE Prepared:	8/8/2016	Budget: Wastewater

PROJECT INFORMATION

- Scope of Work: Scope of Work is to refurbish evaporators, chlorinators/sulfonators, replace regulating check valves, ejectors, process water valves, gas safety panels, compressors, gas flow meters, and all accessories and appurtenances. This proposed CIP budget is for construction only. The design and construction assistance services are budgeted through "As Needed Engineering Services Contract CS-1481, Task #23".
- Project History: The DMT Disinfection Complex was commissioned in 2003 and was expected to operate until 2023 without any major projects. However budget and staffing reductions caused the scheduled maintenance to be reduced so the equipment condition has deteriorated.
- Driver: 1 Condition
- Challenges: Chlorine and sulfur dioxide are both extremely hazardous toxic chemicals that can impact staff and the public if an uncontrolled gas release occurs. Maintaining staff safety, regulatory compliance, and meeting production requirements is a challenge.
- Other Important Info: *Innovation note: Align with considerations of alternative disinfection. The maintenance of the equipment hasn't been performed at the recommended intervals. Rebuilding the equipment and maintaining them according to OEM specifications would provide reliable performance.

WRRF Chlorination and Dechlorination Process Equipment Improvements

Old CIP# 1222

Related Project: The RRO segment 2, and RRO Disinfection Projects (PC-797) are potentially affected by this task. The PC-797 control and existing DRO Chlorination and De-chlorination system control needs to be integrated during the design and construction phase of "RRO Disinfection Project PC-797" in order to meet NPDES Permit requirements.

CIP 212005: Rouge River Outfall No. 2 (RRO-2) Segment 1 - WRRF Modifications

PROJECT INFORMATION

Scope of Work: The scope of work includes installation of new Stop Log-8 Gates, modification of Movable Dam MD-1, and installation of new power pack building. This project will also provide for a hydraulic actuation system for gates MD-3 A/B and SG 41-44, modification of stop logs SL-1 A/B, and replace chlorination/dechlorination tank car emergency shutoff valves. The project will further include modification of PLC based control system, capping abandoned PC-709 precast tunnel lining segments.

CIP 212006: Rouge River Outfall (RRO) Disinfection (Alternative)

Manager: Philip Kora Managing Dept WW Eng

PROJECT INFORMATION

Scope of Work: The consultant shall provide comprehensive professional services for project oversight and Owner's representation for the PC-797 RRO Disinfection Progressive Design-Build Contract. The scope of work consists of completing basis of design, design and construction services to develop and implement a solution that will result in 100% disinfection of wet weather flow discharged from WRRF to Detroit River outfall and Rouge River Outfall in order to meet NPDES Permit requirements.

Project History: The DR0-2 Outfall was originally designed in 1998 under CS-1150, and construction began in 1999 under PC-709. Some surface construction work and substantial underground work were performed, including construction of the entrance shaft, two access shafts, six diffuser riser shafts in the Detroit River, and about half of the length of the tunnel. On April 23, 2003, uncontrollable high rates of ground water mixed with Hydrogen Sulfide (H2S) inflow flooded the tunnel, and it has remained so since that time.

After the tunnel flooded, GLWA (then DWSD) terminated the PC-709 contract and looked for other alternative to complete the work. After further study of the tunnel construction a different alternative was considered and thus, scope for the Modified Detroit River Outfall No. 2 (MOD DR0-2) under CS-1448 design was established. This contract called for a design to construct a new rock tunnel at a higher elevation with Slurry Shield Tunnel Boring Machine (TBM). The design of the MOD DR0-2 was completed on December 2007 and the construction of the DR0-2 project

Cost Center: 892211

WRRF Rouge River Outfall (RRO) Disinfection (Alternative)

Old CIP# 1302

under PC-771 was started on November 2008. Due to economic hardship during the fiscal year 2008/2009, DWSD requested MDEQ to terminate this contract. After further discussion an agreement reached with GLWA (then DWSD) and MDEQ to allow termination of this Contract and look for feasible and cost effective solutions to meet the wet-weather discharge to Rouge River Outfall. Therefore, on April 2009, GLWA (then DWSD) terminated the PC-771, MOD DR0-2 Contract.

The Rouge River Outfall No. 2 (RR0-2) proposal was first developed in 2009. The RR0-2 was to be a ground level conduit extending approximately 2,500 feet to the intersection of the Rouge River and the Rouge Shipping canal. The RR0-2 conduit was to be used during the wet-weather events and primary effluent to the river shall be disinfected by mixing of Chlorine and De-chlorination. The Basis of Design (BOD) for the RR0-2 project was issued on November 6, 2009. GLWA (then DWSD) performed a RR0-2 Segment- 1 contract to do the ancillary work such as modification of gates, stop logs and chlorine tank shut off valves at WRRF.

In 2012/2013 the WRRF commissioned a study of the feasibility of alternative disinfection methods for meeting the requirements of the Rouge River Disinfection. The results of this study and a subsequent hydraulic study came to the conclusion that the existing conduits to the Rouge River had sufficient contact time to properly disinfect and dechlorinate the secondary effluent from the WRRF. If a method could be designed to shunt secondary flows to the Rouge

River during wet weather and send primary effluent through the longer DRO, then a substantial savings would result from a new design approach. This approach was further explored and discussed with the MDEQ. The result is a NPDES permit modification allowing for the construction of the proposed Rouge River Outfall Disinfection project, keeping the April 2019 project completion date that had been in the NPDES permit.

CIP 212008: WRRF Rehabilitation of Intermediate Lift Pumps (ILPs)

and 2.

ILP Station No. 2 houses ILP Nos. 3, 4, and 7. The pumps are vertical turbine pumps with a maximum rated design capacity of 350 MGD each and a motor size of 2,500 hp. The pumps are also equipped with VFDs. ILP Nos. 3 and 4 feed Aeration Deck Nos. 3 and 4, while ILP No. 7 is a swing pump and can be used to transfer wastewater to Aeration Deck Nos. 2, 3, or 4.

- Driver: 3 Regulatory
- Challenges: Maintaining the required wet weather secondary capacity of 930 MGD.

WRRF Rehabilitation of Intermediate Lift Pumps (ILPs)

Old CIP#

Other Important Info: *Innovation note: May need to resize if nutrient removal is added - year-dependent.

Related Project: PC-796: Aeration System Improvements, which is under construction.

- Scope of Work: The study, design and construction for the rehabilitation of the central offload facility includes bin activators, rotary feeder valves, knife gate valves, bottom hoppers, conveyors, and other associated items. The work also includes rehabilitation of HVAC system of the entire facility, lime offloading system, drainage system, elevator, and doors.
- Project History: The Central Offload Facility was built under PC-744 (DWP-1074) as a design build project in 2005. The project completion was delayed due to the lime sludge slide gates on the lime mixers which were continuously leaking whenever sludge head in storage bins was high. This problem was finally resolved after replacing the gates. Due to the nature of lime and sludge and continuous operation of this facility, the equipment started failing causing various operational and maintenance problems. Eventually, the facility needs a major rehabilitation.

Driver: 1 - Condition

Challenges: Maintaining the MDEQ-NPDES required capacity during the construction phase of the project.

Managing Dept	WW Eng	

PROJECT INFORMATION

- Scope of Work: Provide basis of design report for decommissioning of the Complex-I demolition and relocation drawings for existing pass through utilities. Provide recommendation for future reusability plan for Complex I. The demolition cost and construction assistance, and relocation of utilities is not included in this budgeted CIP. The budgeted CIP includes study, design and minimum rehabilitation to install heating to continue utilizing the building other than incinerations. The cost to demolish equipment and rehabilitate the existing building for reuse is very high and further capital investment is deferred until reuse need of this building is well defined.
- Project History: Complex I was installed and in operation since the 1940's and has completed its valuable life cycle. The Bio-solids Alternatives Evaluation at the WWTP evaluated several options for long-term dewatering disposal as it relates to overall, and more specifically, the Complex I Incinerator Facility. Most of the options indicated that a long-term phasing out of Complex I especially due to its aged equipment and challenges of meet regularity requirements.

Driver: 3 - Regulatory

Challenges: Possible challenges with this project will include shutdowns of the secondary water system and abatement of asbestos and lead for this building built 1940's. Some utility service lines may be shared with adjoining Complex II Incinerator and Complex I Dewa

Old CIP# 1284

Other Important Info: *Innovation note: Future uses may include alternative sludge handling; keep aligned with Master Plan and Research & Innovation.

PROJECT INFORMATIO	N								
Scope of Work: The sc	one o	f work includes study design and c	onstruction for the ren	lacement of sludge feed numps SEP 1, 2, 5 and 6 and other modifications to					

the pumping system at the WRRF.

Project History: Water Resource Recovery Facility (WRRF) has six (6) Sludge Storage Tanks (SST-1, 2, 3, 4, 5 & 6), which feed sludge to the dewatering facilities (i.e. belt filter presses complexes and complex II centrifuges.) Typically, sludge from Storage Tanks 1 & 2 supplies the centrifuges on dewatering complex II upper level; sludge from Storage Tanks 3 & 4 supplies the centrifuges on the lower level of Dewatering Complex II; and sludge from Storage Tanks 5 & 6 supplies the belt filter presses in Dewatering Complex I. However, control valves in the Dewatering Complex II basement allow sludge from any storage tanks to supply any Dewatering area.

Under Contract PC-792, Storage Tanks SST-3 & 4 along with Sludge Feed Pumps SFP-3 & 4 are to be dedicated to BDF Facility.

Driver: 2 - Performance

Maintaining Plant Operational Capacity during construction. Challenges:

Other Important Info:

Describe Here the Changes from the 2018 CIP to 2019 CIP

The original BCE submitted for the 2018-2022 CIP estimated projected expenses at \$3.3M for this project. Revisions made for the final 2018-2022 CIP at \$1.2M were incorrect. Based upon revisiting the scope of work and the schedule, the 2019-2023 CIP projected expenses were slightly higher than the original BCE.

CIP 213007: Modification to Incinerator Sludge Feed Systems at Complex -II

Project Title WRRF Modification to Incinerator Sludge Feed Systems at Complex -II

Project Significance GLWA have an ongoing study and design of sludge cake conveyance system improvements project after the March 4, 2016 fire incident in Complex –II Incinerators building. The construction of this project will provide a cleaner, fire resistant, reliable and safe sludge feed to the incinerators.

Year Added:	2016	CIP Type: Project

PROJECT INFORMATION

Scope of Work: The restoration of sludge conveying capacity, which was lost due to the fire damage and to provide improved sludge conveyance from each dewatering facility to the incinerators. Replacement of 19 MCCs and Replacement of the Unit Substation EB-26 in Incineration Complex II.

Project History: The C-II Incineration complex is over 40 years old. Major rehabilitation had been deferred over the years in anticipation of an alternative Biosolids disposal solution to handle all the solids. The Complex-II have many major pieces of equipment that are nearing the end of their useful life and require replacement or major rehabilitation in order to be used as the primary long-term solids disposal method. GLWA approved a PC-774 and PC-791 contract to rehabilitate some of the aging problem of the incineration and to meet the new air permit requirements. GLWA just completed the construction of a Biosolids Dryer Facility (BDF) with a firm capacity of 316 dry tons per day. The BDF facility is currently in operation under an in-term agreement with NEFCO. The current GLWA plan for Biosolids disposal is to utilize BDF to its capacity first, then send the additional load to Complex-II Incinerators and anything beyond that to the land fill. This Biosolids Disposal Plan requires investment in the Complex-II Incinerators to process the sludge loads on a regular basis for the daily and wet weather events to avoid the highest cost of land fill. The sludge from Dewatering Complex II travels through a series of conveyor belts (i.e., conveyors G, H and J) before it reaches Incineration

WRRF Modification to Incinerator Sludge Feed Systems at Complex -II

Old CIP# 1311

Complex II. The sludge from Dewatering Complex II Lower Level was transported by Conveyor G to Conveyor H. In Incinerator Complex II, Conveyor H branches to Conveyors K and L then continue to various conveyors to feed incinerators. The sludge from Dewatering C-II Upper Level was transported by Conveyor J which branches to Conveyors M and N in Incineration C-II then continue to various Conveyors to feed incinerators. The conveyor belt structures in Incineration C-II are old, have been modified, rebuilt or repaired several times that might have altered the overall integrity of the structures. The existing "Dusseau" hopper oftentimes plugged resulting to sludge spillage. The existing feed system to the incinerator from the hoppers should be redesigned and replaced. New control systems, safeguards, provision of SFE water, run time meter or tie to ovation system and poor lighting system in the complex needs improvement.

Drainage problems had historically existed within the basement of Complex II Incineration and C-II Dewatering having to do with both building drainage, and filtrate drainage. These problems led to excessive demands on operations and maintenance staff, shutdown of process-related equipment, and safety concerns for WWTP personnel. Improvements to the C-II Incinerators building drainage system were completed in 2003 under contract DWP-1028. However, the drainage problems were not completely eliminated and still continue to exist and further Improvements to the C-II Dewatering are in design for improvements. In order to have an effective sludge conveyer's wash system, a key requirement for safe operation of sludge conveyance system, the drainage improvements in the Complex-II Dewatering and Incinerators building are essential.

Driver: 3 - Regulatory

Challenges: Maintaining the sludge conveyance capacity to meet permit requirements during the construction of these improvements, will be the most significant challenge on this project.

Other Important Info: n/a

Related Project: The change order to Contract PC-791 was issued by GLWA to address the fire emergency and restore the operation of C-II Incineration.

Describe Here the Changes from the 2018 CIP to 2019 CIP

Additional scope to the previous CIP. Construction of two Small Capital Projects, Replacement of 19 MCCs and Replacement of the unit substation EB-26, were combined with this construction project to avoid multiple shut downs in Incineration Complex II and to coordinate the works more effectively. The estimated cost has also changed.

CIP 213008: Rehabilitation of the Ash Handling Systems

Old CIP# 1383

PROJECT SUMMARY	 Innovation MP Right Sizing System Reliability 	Project Status Future Planned	Project Status Guide: Active: One or more phases have started, including procurement New: First appearance in CIP Future Planned: No Phases have Started Cancelled-Closed: All Phases Have Officially Closed or Project Cancelled Pending Closeout: Project at Substantial Completion but not closed out Archived: Project closed or completed for more than one year
			Reclassified: Projects that have been merged with other projects

Project Title WRRF Rehabilitation of the Ash Handling Systems

Project Significance The ash systems convey and store ash for ultimate disposal. The incinerators cannot be used if both the systems are not working.

Year Added:	2017	CIP Type: Project
Date Original BCE Prepared:	7/27/2016	Budget: Wastewater
Date BCE Last Updated:	9/18/2017	Project Classification Level 1: Wastewater
Project Engineer/Manager:	Alfredo Lava	Project Classification Level 2: WRRF
	Engineer	Project Classification Level 3: Residuals Management
	(313) 297-5940	Project Location: City of Detroit
Email:	Alfredo.Lava@glwater.org	Fund: 5421
Manager:	Ali Khraizat	Cost Center: 892211
Managing Dept	WW Eng	

PROJECT INFORMATION

- Scope of Work: The scope of work will include study, design, and construction for the rehabilitation of the wet and dry ash systems. The scope will also include the piping, valves, isolation gates, vacuum pumps, air filters, HVAC, boilers, miscellaneous silo repairs (concrete, access, etc.) site work and drainage, and miscellaneous structural repairs (foot bridge, spalling concrete, etc.) at the dry ash handling system. It will also include the pumps, piping, and sluicing system at the wet ash system.
- Project History: The C-I and C-II Incinerators have been the primary source for processing Biosolids at the GLWA WRF since the plant was first built. The original ash handling system was a wet ash/sluicing process. The dry ash system was constructed in the 1960s and expanded with the construction of the C-II Incinerators in the 1970s. The wet ash system has not been in use for over five years and there is no backup if the dry ash system goes down. The C-I Incinerators are planned to be decommissioned in the next year or two and there is a potential to link the C-I ash handling system to the C-II system to provide extra storage.

Driver: 1 - Condition

Challenges: Maintaining the dry ash system at capacity while the wet ash system is being built will be a challenge.

Other Important Info: *Innovation note: Due to only 10-15 years remaining useful life on Complex I, reconsider recommissioning wet ash. Recommend focusing

Old CIP# 1383

on reuse of dry ash elements of Complex I, and adding redundancy and automation to the dry ash system.

Related Project: This project should be coordinated with the decommissioning of the C-I Incinerators as well as any planned plant wide pipe rehabilitation program.

CIP 213009: Phosphorous Recovery Facility at the WRRF

Managing Dept WW Eng

Cost Center: 892211

PROJECT INFORMATION

- Scope of Work: The scope of work will be a study that includes: quantifying the amount of phosphorous in the sludge streams, estimating the potential amount of phosphorous that can be recovered, evaluating the potential market for recovered phosphorous, evaluating the alternatives for recovering phosphorous, developing an alternatives evaluation that includes life-cycle cost estimates and overall cost benefit analysis, identification of potential locations for a phosphorous recovery facility (if proven feasible), and preliminary layouts of facility equipment (if feasible). Construction of the facility if feasible.
- Project History: There are phosphorous effluent permit limits for both primary effluent (during wet weather) and for secondary effluent. Effluent limits for phosphorous were lowered again in 2016 and now stand at 1.5 mg/l for primary effluent and 0.7 mg/l (October – March) and 0.6 mg/l (April – September) for secondary effluent. GLWA has historically been able to meet the phosphorous limits for both primary and secondary effluent by adding ferric chloride to the primary clarifier influent and relying on normal phosphorous consumption in the secondary treatment process. By removing phosphorous in both the primary and secondary processes, phosphorous is then concentrated in the primary and waste activated sludges. Phosphorous is a valuable commodity that can be reused in other products such as fertilizer. The recovery of phosphorous is becoming more prevalent at other WWTPs.

Old CIP# 1399

Driver: 6 - Public Benefit

Challenges: Potential locations for a phosphorous recovery facility.

Other Important Info: n/a

Related Project: Related projects include the ferric feed at both PS-1 and PS-2. These projects are for removing phosphorous from the liquid stream. The PS-1 project will also include study of alternative ferric feed locations for phosphorous removal. This study should also be coordinated with the BDF. If the BDF plans to sell the dried Biosolids pellets, coordination with any required phosphorous content in the pellets needs to be done.

PROJECT INFORMATION

Scope of Work: Relocate Industrial Waste Control Division and Analytical Lab to New Administration Building at WRRF. Consolidate the existing Operations Lab with Analytical Lab.

Project History: In accordance with the NPDES Permit, GLWA implements and enforces an Industrial Pretreatment Program (IPP), and regulates the discharge of wastewater from commercial and industrial sources throughout the service area. A key component of the IPP includes the performance of analytical testing on wastewater samples collected from industrial and commercial sources, in-system samples from the sewer system and other sources including groundwater and septage.

The Industrial Waste Control Division (IWC) is responsible for implementation of the IPP, and analytical services are obtained from the Analytical Laboratory located at the MCHT facility. IWC activities are housed at the Livernois Center Building (LCB) located at 303 S. Livernois, while the Analytical Laboratory leases space at the MCHT on Second Avenue.

The State of Michigan Department of Transportation and the Govt. of Canada have proposed to construct a new bridge crossing across the Detroit River, with a completion date of 2020. The Livernois Center Building lies within the area designated for the Bridge and support services and need to be relocated. It would be desirable to relocate the laboratory facilities at the same time to optimize the operations and make use of

Old CIP# 1285

WRRF Relocation of Industrial Waste Control Division and Analytical Laboratory Operations

underutilized GLWA facilities rather than lease space from a 3rd party.

Driver: 3 - Regulatory

Challenges: Maintaining the laboratory operations during relocation.

Phone: (313) 297-5922

Email: christopher.nastally@glwater.o

- Scope of Work: This program is intended to include studies, design, construction administration, and construction projects which serve to improve process areas or functions of the CSO Facilities. The overall scope of this program is to facilitate improvements to the disinfection systems, screening systems, facility automation, safety systems, flushing systems, instrumentation & controls, electrical systems, various buildings systems (HVAC, lighting, etc.), and other miscellaneous improvements identified at the facilities throughout the life of this program. The primary drivers of these improvements will be obsolescence/end of service life, excessive O&M problems, reliability, efficiency and system standardization which arise from feedback from operation & maintenance, the scheduled replacement plan, and the needs assessment.
- Project History: The GLWA CSO Control Program consists of the operations of 6 CSO RTB's, and 3 Screening & Disinfection Facilities (SDF). The fundamental difference between the SDF's and the RTB's is the presence of a bonafied basin versus a large diameter, long effluent pipe/ outfall. The long outfall (SDF) functionally serves a purpose similar to the basin (RTB) in terms of storage of combined sewer overflow during a rain event. As a result, the SDF's are fundamentally more difficult to keep clean than the RTB's because flushing systems must transport settled solids (after a storm) long distances to leave the effluent pipe. The CSO Facilities average age is around 15 years with the oldest facilities being constructed in

New CIP# 215001

CSO FACILITIES IMPROVEMENT PROGRAM (Reclassified)

Old CIP# 1384

1994 and the most recent facility being constructed in 2011. A scheduled replacement plan was completed in 2013 along with a needs assessment conducted in 2016. These efforts, along with continuous feedback from operations and maintenance, are the main drivers at the onset of this program. Establishment of condition of the facilities is planned as a part of O&M but may demand resources under this program depending on the nature, risk, and degree of issues identified during these various condition assessment/inspection programs. A Goal of this program includes standardization of the systems utilized at each facility. Given the eras in which they were constructed, and being part of demonstration projects, they have differing technology which makes maintenance and operations duties more difficult. Another goal of this program is to improve the operating conditions of facility assets to increase reliability, efficiency, and compliance with all GLWA regulatory and other levels of service.

Driver: Varies

Challenges: As this program starts off, there is a lot of design RFPs in the beginning which will lead to large scale construction projects in the later years (3-5). A significant challenge to be faced will be maintaining the CSO facilities in current operations without the benefit of large-scale improvements of the CSO Systems. Another significant challenge of this program will be unforseen conditions that may be encountered as facility inspections & condition assessments begin. For example, finding significant structural distress of a basin could lead to increase of budget or extension of timeline of improvements. Considering much of the equipment/systems identified for inclusion in this program are at or near obsolescence or are actively causing O&M issues, delays in improvements could possibly cause operational or compliance issues.

Other Important Info: (Replaces CIP1313).

Related Project: The proposed new CIP budget for rehabilitation for all the CSO RTB and SDF facilities is based on the 2016 Needs Assessment Study Report and condition assessment performed under CS-1499, Task 18. The condition assessment identified deficient process equipment, systems and deteriorating structural conditions that required near-term remedial work at the three RTB's: the Puritan-Fenkell Basin and dry weather pump station (completed in 1998 under PC-697), the Seven Mile (Completed in 1999 under PC-696) and the Conner Creek (completed in 2005 under PC-739). The 2016 Needs Assessment Facility walkthrough have identified that CSO RTB and SDF's at Hubbell Southfield, St. Aubin & Leib, Baby Creek and Bell Isle needs rehabilitation. The Puritan-Fenkell and Seven Mile RTB's will be combined with this new capital improvements plan for all the remaining CSO facilities. GLWA staff have identified that Conner Creek CSO facility rehabilitation is critical to the wastewater operation and few projects has initiated as an emergency repair work. Due to recent rain events under emergency repair activities the following scope items at GLWA's Conner Creek CSO RTB are ongoing; Install additional automation, continue repairs to existing automation, replace five sodium hypochlorite pumps, repair piping leaks and relocate piping for the flushing water system, replace 5 Accusonic meters upstream, replace electrical power and controls raceway above the RTB, replace emergency relief gates causing concrete damage, replace all disinfection valves, replace all insulation and heat taping for exposed sodium hypochlorite lines, replace all sodium hypochlorite mixers in the channels. The above Conner Creek CSO RTB facility emergency repair list include only operation critical rehabilitation needs to avoid flooding's, the remaining non critical rehabilitation needs identified in the Needs Assessment Report will be addressed through this proposed project at this facility.

Describe Here the Changes from the 2018 CIP to 2019 CIP

Costs for FY 2019 construction have increased due to the emergency nature of the required projects at the Conner Creek CSO Facility. There are costs for FY 19/20 for construction in the program that are placeholders in case any of the inspection programs under maintenance find issues with the facilities which are emergency in nature and require repair immediately. Furthermore, the costs from the 2018 CIP to the 2019 CIP have increased significantly, primarily in Fiscal Years 21,22,23, and 24 & Beyond. The primary reason for this is the items previously identified in the CIP were not laid out and grouped as projects to determine total project cost and lay out the projected completion of these projects from design-phase to construction-phase. Beginning in FY 18, a significant effort is anticipated by the emerging CSO Control Program Group to develop several RFPs seeking design-phase consulting assistance to complete the identified projects from the Needs Assessment, Scheduled Replacement Plan, and those identified by Operations/Maintenance as equipment which requires significant effort to maintain & operate or has failed. The RFPs and resulting design work are anticipated to ramp up heavily in FY20 with the fruits of those designs (construction projects) beginning construction in FY 21 and continuing through FY 23. Beyond FY 23 is a budgeted amount which will most likely

New CIP# 215001

CSO FACILITIES IMPROVEMENT PROGRAM (Reclassified)

Old CIP# 1384

change over the next fiscal year or two as more information is obtained in assessing the CSO Facilities condition and as efforts from the Wastewater Master Plan may affect the overall direction of the program. This same goes for the identified design (consulting) efforts which are presently shown to tail off in FY 22. As more projects become identified and prioritized, the design efforts for FY 22 and beyond will likely require adjustment under this program, or possibly could justify their own CIP project number and means of individual tracking. PROJECT INFORMATION

Scope of Work: The potable water supply to WRRF is experiencing low pressure problem. The study design and construction for the secondary water system improvements to improve reliability and water pressure to the WRRF ids required. Other tasks include repair/replace the aging and corroded pipes, valves and fittings for Potable Water Supply System. Repair/replace the aging and corroded pipes, valves and fittings for Natural Gas system. Repair/replace the aging and corroded pipes, valves and fittings for the SFE system. Repair/replace the aging and corroded pipes, valves and fittings for the Compressed Air System. Design and Install Compressed Air to supply the required air to the pneumatic tools in Pump Station #2.

Project History:

Driver: 1 - Condition

Challenges: Temporary air, water, natural gas system shutdowns may be required to perform the work.

Rehabilitation of Various Sampling Sites and PS#2 Ferric Chloride System at WRRF

Old CIP# 1223

required to be rehabilitated or replaced for meeting the permit sampling requirements. These sampling stations regularly fails to collect samples due to the clogging problem in the sample line. Replacement of existing sampling equipment, installing new samplers, pumps, HVAC, etc. were also proposed through Need Assessment 2010 – 2016 for these sampling stations.

The WRRF sampling station rehabilitation design is completed under an As Needed Engineering Services. The WRRF PS# 2 Ferric Chloride rehabilitation design is completed under another As Needed Engineering Services Contact. These two projects are combined together for construction under the revised CIP #1223 in the 2018 CIP.

Driver: 2 - Performance

Challenges: Maintaining the MDEQ-NPDES required capacity during the construction phase of the project.

Other Important Info: *Innovation note: Rehab may include alternative online/real-time sampling & analysis, as well as improved mixing of the ferric with primary influent.

The original CIP Project Proposal CIP-1223, "Rehabilitation of Grit and Screening System at PS-2 and Rehabilitation of Sampling Sites at WWTP" included two major scope items; Rehabilitation of Grit & Bar Screening System and Sampling Stations. That construction budget for CIP-1223 amount \$11 M was set aside in CIP. The design for Grit & Screening System and Sampling Station were complete under As Needed Engineering Services Contract, CS-1481 Task 18. The construction for "Rehabilitation of Sampling Sites" will move forward and be bid out separately for construction without Grit & Bar Screening System. The Bar Rack System and Grit System designed under As Needed Engineering Services Contact CS-1481, Task 18 will not proceed for construction as designed. An engineering decision to have a fresh look and start a new study, design and construction project through CIP-1314 will proceed. The proposed CIP budget is for construction cost only. The original budget for CIP-1223 was \$11M and has been reduced to \$5M. The remaining \$6M budget has been transferred to CIP-1314 to complete study, design and construction of Grit and Screening System at PS#2.

Related Project: CIP 211008 also concerns Ferric Chloride system.

PC-757: Rehabilitation of Primary Clarifiers, Drain Lines, Hot Water, and Scum Lines, PC 789 – Pump Station No. 1 Rack and Grit Building, MPI and JSS Improvements, PC 795 – Pump Station No. 2 Improvements.

PROJECT INFORMATION

Managing Dept WW Eng

Scope of Work: Study and Evaluate the existing maintenance facilities throughout the plant for suitable modifications to provide sufficient storage and better maintenance areas. The various building systems, including heating, ventilation, electrical, and lighting would be improved to be in compliance with applicable building codes and regulations.

Construction of the suggested modifications will follow.

- Project History: The main facilities such as Main Plant Maintenance Building, Vehicle and Grounds Maintenance Building, Dick Storage Building, Machine Shop Building, Chain Storage Building, Fire Brick Storage Building, and miscellaneous maintenance shops in the Incineration and Dewatering complexes are spread throughout the WWTP. Some of the buildings are in bad condition and need rehabilitation. Based on the current GLWA maintenance structure with new optimization plan implemented the need for a consolidated and distributed maintenance area(s) be studied for design and rehabilitation of existing maintenance buildings or construction of new Maintenance Building. Also, WRRF work environment is deteriorating and some of the roads and paving needs rehabilitation. The Plant wide Critical roads have been paved under the PC-783 contract. Other items identified as part of approved CIP-972 was consolidated with this CIP 1237.
- Driver: 2 Performance

Challenges: Requires significant input from Operations and Maintenance due to changes in the organizational structure and functions since the original CIP proposal approved on 03/11/11. Also, require temporary work spaces to accommodate new rehabilitation of the existing maintenance areas.

GI W/A FV 2019-2023 CIP

Project Title Rehabilitation of Potable Water, Screened Final Effluent (SFE), Natural Gas, Secondary Water System and **Compressed Air Pipelines & SFE Pump Station**

Project Significance The utilities are vital to the operations of the WRRF. The integrity of these systems will be maintained with this project. The SFE Pump Station provides SFE water to many of the GLWA WRRF treatment processes and needs to be completely rehabilitated to maintain uninterrupted supply of SFE water to these processes. The Secondary Water system needs to be relocated or completely refurbished to provide uninterrupted water for fire protection and process applications such as seal water to the pumps.

PROJECT INFORMATION

Scope of Work: This project will include the study, design, and construction for the needed improvements to the SFE and Secondary Water pump stations. This includes required capacity, pumps, strainers, piping, controls, building improvements, and electrical supply. It is possible that the secondary water system may need to be relocated. This will also include a study to evaluate the potential for replacing the secondary water utilization with SFE utilization where feasible and an alternative analysis to the existing carrier water at chlorination/dechlorination facility. The distribution models for both water systems will also be updated. A redundant potable water feed to the WRRF will also be evaluated. The evaluation of all alternatives will include the ability to reduce energy and potable water usage.

This project will also include study, design and construction of the repair/replacement of the aging and corroded pipes, valves and fittings for the

Rehabilitation of Potable Water, Screened Final Effluent (SFE), Natural Gas, Secondary Water System and Compressed Air Pipelines & SFE Pump Station

Old CIP# 1381

Potable Water Supply System, the Natural Gas system, the SFE system, and the Compressed Air System. The As Builts for all the utilities will be generated as part of this project.

Project History: The SFE pump station has eight pumps with a total capacity of approximately 135 MGD. Pumps 1,2,4, and 6 were installed in 1973, pumps 3 and 5 in 1980, and pumps 7 and 8 in 1998. The older pumps were rebuilt in 1998. Strainers have been reconditioned as necessary over time. Due to the critical nature of the SFE pump station and the elapsed time since a major rehabilitation (over 15 years), a significant upgrade/rehabilitation is required. In addition, the two 5 kV transformers that supply power from EB-3 are approximately 40 years old and are in need of replacement. The secondary water system headworks was rehabilitated in 2006. However, due to moisture and chlorine in the room air, there has been significant corrosion of the piping, valves and other equipment. A complete rehabilitation of secondary water system headworks is required.

Some of the pipe lines at the WRRF have been inexistence since the plant was built and have been found on record dating back to 1938. As the plant has grown, so have the systems. In general, the majority of the changes to the multiple systems occurred when the specific buildings or components to the plant were built or renovated. Therefore, an evaluation and necessary replacement of these pipelines are needed to make sure the integrity of these pipelines.

Driver: 1 - Condition

Challenges: Maintaining the adequate supply of SFE and Secondary Water to the other treatment processes during construction of the SFE improvements, will be the most significant challenge on this project. Temporary air, water, natural gas system shutdowns may also be required to perform the work.

Other Important Info: *Innovation note: Low-hanging fruit - re-use SFE for chlorination/ dechlorination; need package plant to condition SFE.

Related Project: There are no other specific projects for the SFE and Secondary Water pump stations that need to be coordinated with, however many other projects require SFE and Secondary Water and the ability to consistently supply the required quantities will need to be coordinated with these projects during construction of the improvements.

Phone: (313) 297-5909

Email: Philip.Kora@glwater.org

- Scope of Work: The scope of this design-build project includes design and construction of 3rd 120 kV primary electric supply transmission line owned by DTE tapping into the 120-kV Waterman-Zug line in the vicinity of Dearborn St. and Copland St right-of-way at Tower 1368. The design-build services also include securing the property right-of-way easements from the property owners, as well as the design and construction of power transmission supply line. This primary transmission power line will energize the already installed new 120-13.8 industrial substation owned by GLWA near EB-1.
- Project History: The WRRF has been supplied primary electrical power through the DTE Maxwell Switching Station via two power supply lines Maxwell 1 and Maxwell 2. The two main electrical buildings at the WRRF which feed the primary and secondary facilities are Electrical Building 1 and 2 (EB-1 and EB2). EB2 supply electrical power to the pump station #1 and all the primary treatment facilities. EB1 supply power to pump station #2, secondary treatment facilities, dewatering, incineration and all other remaining facilities. The City of Detroit's Public Lighting Department (PLD) provided a redundant 24kV back-up electrical services to EB2 through the City of Detroit 24kV industrial substation. In the event of DTE power supply failure the PLD 24kV power supply line provided redundancy and reliability to EB2. The back-up power supply by PLD at EB-2 required a manual switch over in the event of DTE power failure. The City of Detroit's PLD discontinued its power generation in the late 1980's. PLD also started curtailing electrical power supply distribution to its customers. The study by HRC in 1988 and later by Metcalf & Eddy in the early 90's during design and construction of Pump Station # 2 project identified the need for a 3rd primary electrical supply line. In order to provide reliable and redundant

GLWA Great Lakes Water Authority

New CIP# 216007

DTE Primary Electric 3rd Feed Supply to WRRF

Old CIP# 1402

primary electric power supply to the WRRF after the September 8, 2011 power failure event, GLWA initiated a consulting services contract "CS-1449 Underground Electrical Duct Bank Repair and EB-1, EB-2 and EB-10 Primary Power Services Improvements at the WWTP". This CS-1449 scope required to study and design reliable and redundant primary electrical power system improvements. The study recommended to abandon PLD's 24kV back-up electric power supply to EB-2 and replace with a 3rd power supply feed line from DTE's Waterman substation. In addition to the 3rd power feed line, the study also recommended a new 120-13.8 kV transformer near EB-1 and a new 15kV power supply line to EB-2, to address power redundancy and reliability. Construction of the primary power services improvements design through CS-1449 were procured through contract PC-783. The contract PC-783 in the 1st guarter of 2016 abandoned and removed the 24kV power feed line and industrial substation owned by PLD. On May 29, 2012, GLWA signed a letter of agreement with DTE to provide a 3rd 120kV feed transmission line owned by DTE (paid by GLWA) to a new 120-13.8 kV industrial substation built and owned by GLWA. The DTE agreed to obtain all required property right-ofway and easements for the route with reasonable effort per the agreement with GLWA. The PC-783 contract allocated \$1.30 Million budget for DTE to execute these services. GLWA, through construction contract PC-783, has already installed a new 120-13.8 industrial substation near EB-1, a new 15kV power supply line from the new transformer to EB-2, and removed 24kV back-up electrical service line and industrial substation owned by PLD. However, DTE failed to get property right-of-way and easements for the route. DTE's original design route for transmission line was along the railroad tracks but the rail company declined to provide right-of-way for DTE's new transmission line. DTE later planned a longer transmission route to buy property from private owners, but a property owner increased the price sensing urgency for GLWA. The new cost estimate by DTE for this new transmission line is \$4.3 Million. GLWA's WRRF requires a reliable and redundant electrical power supply in order to be in compliance with NPDES permit requirements. The disconnection and removal of backup power supply from PLD leaves GLWA vulnerable for power failure and this urgent power supply line needs to be installed at the earliest. In order to speed design and construction GLWA is proposing a design-build project delivery method for the 3rd power supply line project. Presently there is no true redundant primary electrical service feed line to the WRRF, both the primary electric supply lines originate from the DTE Maxwell Switching Station. GLWA's General Counsel is currently working on utilizing the "Condemnation Process" to acquire easement from the private property owners for this route.

Driver: 3 - Regulatory

Challenges: Negotiation with private property owners and testing of the automatic switch over will require co-ordination with operations.

Other Important Info: n/a

Related Project: PC-783 project.

Project Title Oakwood District Intercommunity Relief Sewer Modification at Oakwood District

Project Significance Improvements to the Oakwood District Sanitary Sewer system and implementation of various projects as recommended in report by Applied Sciences, Inc. Dated 2/26/16. Projects to include: 1) Clean & Inspect Trunk Sewers, 2) Analysis and improvement of Oakwood PS/RTB operations, 3) Second influent sewer to Oakwood PS, and 4) NWI Diversion for CSO Control. Projects to be prioritized and validated as part of Wastewater Master Plan Project (GLWA CS-036).

PROJECT INFORMATION

- Scope of Work: The work includes basis of design (study) report on alternative solution to proposed Oakwood District Intercommunity Relief Sewer, diversion of storm water flow, and construction assistance during construction phase of emerging projects. Coordinate with DWSD projects including catch basin restrictions and green spaces.
- Project History: The Oakwood District is located in the southwest portion of the City of Detroit covering an area of 1,520 acres. In general, it's bound within by a continuous stretch of the northerly and westerly bank of the Rouge River, thence stretches of the city limits of River Rouge and Ecorse to the south, thence a stretch of the city limits of Lincoln Park to the far lower west (abutting a stretch of Outer Drive near the adjacent watercourse of Ecorse Creek further west), thence a stretch of the city limits of Melvindale to the north near I-75 (between Outer Drive and Schaefer Hwy), thence a continued stretch of city limits of Melvindale to the upper west abutting Schaefer Hwy (between I-75 and the point of beginning along southerly embankment of the Rouge River adjacent Mellon Ave.

Much of the District was originally platted as Oakwood Village, later annexed to the City of Detroit. Some areas of the District are situated in

Oakwood District Intercommunity Relief Sewer Modification at Oakwood District

Old CIP# 1286

relatively low-lying, flood prone topographies. Much of the combined sewer drainage system was originally designed and built since the 1930's with laterals and larger trunk and intercepting sewers tributary to the former (and present replacement) Oakwood Pumping Station situated near the intersection of Sanders and Liddesdale Street. In early years, combined sanitary and intercepted storm runoff flow drained to that pump station was coarsely screened, pumped (lifted) and, in turn, conveyed though two discharge conduits tributary to a segment of O'Brien Drain--a natural and man-made (modified) stream confluent to the Rouge River--without further treatment.

Whereas much of the remaining area of the District, predominantly that north of Fort Street and east of Schaefer highway (a/k/a Oakwood Heights), is situated on relatively higher terrain. Originally, good portions of this area4 connected to public sewers drained to other streams or outfalls tributary to the Rouge and otherwise drained to the original municipal wastewater treatment plant in Detroit via other lateral, trunk and intercepting sewers tributary to an original 24" siphon connection constructed beneath the Rouge River just south of the Fort Street bridge to the city's 12'-9" Oakwood Interceptor also constructed in the 1930's extending from the WWTP, largely paralleling the Rouge River to a point ending just north of Fort Street beneath Miller Road.

In the 1940's, a 3'-0" sewer was constructed from the original pump station's discharge channel which proceeded northerly beneath Sanders St and thence easterly beneath Fort St to a drop shaft hydraulic structure at below intersection at Bayside St in turn connected with a 24" siphoned sewer running easterly beneath the Rouge River and connecting with a downstream hydraulic connection to the City's 12'-9" Oakwood Interceptor (later renamed Oakwood Northwest Interceptor, or ONWI) tributary to the WWTP (originally built in the 30's and placed into operation in early 40's) to primarily convey pumped sanitary (dry weather) flow from the southerly portion of the District to the treatment plant. Continued sewer modifications in the District promoted the interception and routing of combined flows in other areas underserved to the pump station via larger intercepting sewers constructed along Pleasant, Sanders and elsewhere connecting with the main Liddesdale Interceptor—the primary influent sewer to pump station.

In the 1950's, to meet increased service needs in the far western sewer districts of the City of Detroit and neighboring communities of Wayne County and otherwise mitigate increased public health risks, the county (with endorsements from a coalition of these municipalities) commissioned construction of the 10'-0" cylinder Northwest Interceptor (NWI). The NWI was constructed in segments, phased over 10 years. Its alignment generally extends 15 miles northwest from its terminus near Fort and Bayside within the Oakwood District --largely following the original watercourse of main trunk of the Rouge thence northerly beneath the Southfield Freeway (M-39) to a connection with the tributary 7'-6" cylindrical Ford Road intercepting sewer—which transports upstream drainage from Detroit's Rouge River District as well as drainage from several hydraulically-connected suburban communities. The NWI's transport capacity, although initially sized to convey wet weather flows resulting up to the typical 10-year uniform rainstorm simulated across the collection system, contributes to ¼ or more of all annual tributary influent flows to the WRRF, on average—depending on prevailing transport capacities along its extensive run as well as limited transport capacities within the downstream ONWI.

It should be recognized that the sole hydraulic-connection from the Oakwood Sewer District for drainage to the NWI is via a drop manhole connection of the aforementioned 36" sanitary discharge main leading from the new (replacement) Oakwood pump station and integral CSO retention treatment basin built in 2011 (PC-755). This connection, which is located beneath Fort St just upstream of the above-mentioned 1950's hydraulic drop shaft structure located at Fort at Bayside with a connected 6'-3" siphon to the ONWI. For more information on Oakwood District refer to Section 2.4 of the linked Description of Sewer Service Districts from the 2003 Wastewater Master Plan, some subject to revisions, since the Oakwood Pump Station and CSO Control Facility was constructed in 2011. Also for further reference, refer to linked Oakwood District Sewer Maps.

Prior Drainage Plans; Continued Interim Plans As part of overall renovation, larger, deeper intercepting sewers and relief sewers were proposed to

Oakwood District Intercommunity Relief Sewer Modification at Oakwood District

Old CIP# 1286

Oakwood District to alleviate the surcharging and flooding of basement. Contact PCS-79 (2011) implemented sewer modifications designed in the Oakwood Heights area as well as Junction Chamber No. 1 at the headworks (influent channels) to the new Oakwood pump station/CSO RTB just east of Pleasant Ave; PCS-80 (2012) implemented select designed relief and replacement sewers in tributary area to the existing 9'-0"- Liddesdale intercepting sewer. In addition, the proposed system also consisted of a replacement of the existing sewer systems through the district area. The existing sewer system generally consists of sewer line located behind homes, which is connecting sanitary flows from homes and storm flows from the catch basins located in the street.

Previously, GLWA authorized a new task to Applied Science, Inc. (ASI) under CS-1482 to perform the baseline hydraulic and hydrologic analysis for the impacted areas of the Oakwood District based on the recent condition of the site, such as conversion of the green space by the Marathon Oil Company, current hydrologic factors given the current land use, and assessment of other land and abandoned properties.

Moreover, extended efforts have been undertaken by ASI, as engineering representative of Wayne County, and GLWA to address wet weather capacity needs for the intercommunity districts tributary to GLWA's NWI and the county's Rouge Valley Interceptor (1965) illustrated on above map)--which are hydraulically-connected with a passive structure (B-097) built in the 1960's at their crossing (i.e., double 6'-6" siphons of the RVI beneath the NWI's alignment) in proximity of Pleasant Ave and Oakwood Ave intersection.

Driver: 2 - Performance

- Challenges: Maintaining the wet weather contract capacities and adequate CSO treatment during extreme storm events and mitigate basement and street flooding in the District and intercommunity regional districts are the most significant challenges for the project to address.
- Other Important Info: Refer to linked aerial photo of Oakwood District with overlay of proposed new sewers, as built drawings of recent construction in the District for PCS-79, PCS-80 and PC-755; map of Intercommunity Collection System including portion of Oakwood District shown above—and other select resources linked below.
- Related Project: CS-1482, Oakwood District Analysis (ongoing); CS-1522 (DWSD), Green Infrastructure; Wastewater Master Plan (GLWA CS-036); CS-1525, Regulatory Assistance

Describe Here the Changes from the 2018 CIP to 2019 CIP

According to ASI Feb 2016 report, there are six projects that should be considered to address the issues within the Oakwood District. These total approximately \$38 million at a conceptual level of detail. The Wastewater Master Plan will review these projects in the context of the overall needs of the GLWA system and develop a comprehensive set of projects to address the Oakwood District. This project will be updated with the results of the Wastewater Plan when available.

PROJECT INFORMATION

- Scope of Work: Preliminary Scope of Work of the Project is as follows: Review the existing records, investigate the existing conditions, provide the necessary cleaning/rehabilitation/replacement to optimize the design capacity of the collection system and to minimize the inflow and infiltration into the collection system.
- Project History: The installation of some of the GLWA interceptors and sewers are dated back to 1912 under various contracts. Detroit River Interceptor inspection was completed in 5 different phases and there were portions deteriorated with visible surface aggregates, attached encrustation and infiltration. Some trunk sewer inspection revealed sludge deposition with reduced transportation capacity.
- Driver: 1 Condition
- Challenges: DRI may have flow control challenges for both inspection and rehabilitation. Recommendations from these inspections may reveal further need for cleaning, rehabilitation or replacement.

Describe Here the Changes from the 2018 CIP to 2019 CIP

CON-183, DRI Repair/Rehabilitation in the Downtown Area is a project that is going for construction in 9/2017. GLWA has requested SRF funding for the rehabilitation of DRI. Availability of this funding is a deciding factor for the execution of the rest of the projects under this program. No projections are made.

Shifted FY2018 & 2019 funds for Future Projects for DRI under SRF Funding

PROJECT INFORMATION

Scope of Work: Provide CCTV and or sonar inspection of the NIEA to reveal the existing conditions as per the National Association of Sewer Service Companies' (NASSCO) Pipeline Assessment Certification Program (PACP) standards, evaluate the existing conditions, and provide the necessary cleaning/rehabilitation/replace to optimize the design capacity of the collection system, minimize the inflow and infiltration into the collection system, and to extend the service life.

Project History: The installation of some of the GLWA interceptors and sewers are dated back to 1912 under various contracts.

NIEA inspection by NTH recently revealed structural deficiencies and sludge deposits. Detroit River Interceptor inspection was recently completed and there were portions deteriorated with visible surface aggregates, attached encrustation and infiltration. Some trunk sewer inspection also revealed sludge deposition with reduced transportation capacity. Inspections of sewers to reveal the existing conditions are necessary and shall be done every 5 to 7 years. Recommendations from these inspections may reveal further need for cleaning, rehabilitation or replacement.

Driver: 1 - Condition

Old CIP# 1332

North Interceptor East Arm (NIEA) Evaluation and Rehabilitation

Challenges: NIEA may have flow control challenges for both inspection and rehabilitation.

Other Important Info: *Innovation note: Consider new techniques for assessment.

Related Project: PCI-4, PCI-18, PCI-19 CIP 222007 also on NIEA

Managing Dept	SCC	

PROJECT INFORMATION

- Scope of Work: Evaluate the existing conditions of the VR-Gates and their structures, provide the necessary design for the replacement of the SCUBA actuators and rehabilitation of the structures, purchase and replace.
- Project History: There are Valve Remote gates throughout the collection system that are installed in 1999 under PC-695. Most of the actuator components have reached their life expectancy and are hard to operate properly. VR-15 and VR-16 had great difficulty in controlling the flow and their SCUBA units were replaced with electrical actuators in 2016 under Small Capital Project SCP-SCC-019. Flow control is essential for the collection system flow management. These gate structures play vital roles in controlling the flow, increasing the storage capacity, and in meeting the NPDES permits.

Driver: 1 - Condition

Challenges: These are operational elements, so flow control may be a challenge.

Other Important Info: Google map of VR-3 and VR-9 are included. VR-4, 5, 6, 10, 11 &13 are also part of the project

Related Project: SCP-SCC-019, PC-695

PROJECT INFORMATION

Scope of Work: Preliminary Scope of Work of the project is construction. Contract CS-168 will review the existing records, evaluate the existing conditions, and provide the necessary design to rehabilitate the outfalls.

Project History: The construction of these outfalls are dated back to the early 1900s under various contracts.

Driver:

Challenges: Some outfalls are below the river elevation; rehabilitation may be challenging.

Other Important Info: n/a

Related Project: CIP 1357, CS-168

Describe Here the Changes from the 2018 CIP to 2019 CIP

CIP 222007: North Interceptor East Arm (NIEA) Evaluation and Rehabilitation from WRRF to Gratiot Ave. and Sylvester St.

GLWA FY 2019-2023 CIP

NIEA Rehabilitation from WRRF to Gratiot Ave. and Sylvester St.

Old CIP# 1411

PROJECT SUMMARY	 Innovation MP Right Sizing System Reliability 	Project Status Future Planned	Project Status Guide: Active: One or more phases have started, including procurement New: First appearance in CIP Future Planned: No Phases have Started Cancelled-Closed: All Phases Have Officially Closed or Project Cancelled Pending Closeout: Project at Substantial Completion but not closed out Archived: Project closed or completed for more than one year Reclassified: Projects that have been merged with other projects
-----------------	---	----------------------------------	---

Project Title NIEA Rehabilitation from WRRF to Gratiot Ave. and Sylvester St.

Project Significance Rehabilitation and replacement program of the existing NIEA based upon structural deficiencies identified from the evaluation results. This is essential to optimize the transportation capacity of the GLWA collection system and to increase its life expectancy.

Year Added: 2017 Date Original BCE Prepared: 3/3/2017 Date BCE Last Updated: 8/25/2017 Project Engineer/Manager: Todd King Title: Director - Field Services Phone: (313) 926-8114 Email: Todd.King@glwater.org Manager: Todd King

Managing Dept Field Services

CIP Type: Project Budget: Wastewater Project Classification Level 1: Wastewater Project Classification Level 2: Field Services Project Classification Level 3: Interceptors Project Location: City of Detroit Fund: 5421 Cost Center: 892211

PROJECT INFORMATION

Scope of Work: Preliminary Scope of Work of the Project is as follows: Review available data, provide the necessary rehabilitation/replacement option, design and implement them to optimize the design capacity of the collection system, minimize the inflow and infiltration into the collection system, and extend the service life.

Project History: The installation of some of the GLWA interceptors and sewers are dated back to 1912 under various contracts.

NIEA inspection upstream of this segment by NTH recently revealed structural deficiencies and sludge deposits. Recent Detroit River Interceptor and North West Interceptor inspections revealed that there were portions deteriorated with visible surface aggregates, attached encrustation and infiltration. Some trunk sewer inspection also revealed sludge deposition with reduced transportation capacity. Inspections of sewers to reveal the existing conditions are necessary and shall be done every 5 to 7 years. Recommendations from these inspections may reveal further need for cleaning, rehabilitation or replacement

Driver: 1 - Condition

Challenges: NIEA may have flow control challenges for both inspection and rehabilitation.

Other Important Info: *Innovation note: Consider new techniques for assessment.

Related Project: CIP 222003 also on NIEA

PROJECT INFORMATION

- Scope of Work: Provide basis of design, and final design for an operational strategy to optimize the utilization of interconnected piping and operation between Connor Creek and Freud pumping stations and the Connor Creek Retention and Treatment Basin. Provide construction of the emerging project and construction assistance during construction of the emerging project.
- Project History: The Connor Creek Pump Station (CCPS) was originally built in 1928 with four storm water pumps, each with a rated capacity of 500 cubic feet per second (cfs). The CCPS was expanded in 1940 adding four more pumps of the same capacity. The pump station currently has a total capacity of 4,000 cfs and a firm capacity of 3,500 cfs. The pumps are primed using a vacuum system that relies on the flooding of the discharge channel siphon to maintain a water seal, which allows the pumps to be primed. Since the Conner Creek CSO RTB went into operation in November 2005, the discharge channel for the CCPS is drained when the CC RTB is dewatered. Therefore, the vacuum priming system cannot prime the pumps. This results in the CCPS pumps being unable to start until the discharge channel is flooded and the vacuum priming system has a seal on the discharge to prime the pumps.

The Freud Pump Station (FPS) was originally built in 1954 with eight storm water pumps, each with a 450 cfs capacity. Two additional pumps were

Freud & Conner Creek Pump Station Improvements

Old CIP# 1315

subsequently installed for dewatering and to act as sanitary pumps during dry weather flows. These two pumps are rated at 35 cfs and 20 cfs and are not operated when the storm water pumps are in service. Under the current operating protocol, the FPS is operated first and results in water flowing to the discharge channel of the CCPS, providing sufficient water to ensure submergence of the vacuum siphon block to allow the vacuum system to prime the CCPS pumps.

The FPS pumps do not require priming during normal operations. The discharge pipe from each pump is tied to three 14' x 14' box conduits which transport flow to the CC RTB. The crown elevation of these conduits is approximately 95' and the lowest ground elevation along these conduits ranges from 96' to 100'. Surcharging and flooding have been reported when the CC RTB is filled to the overflow elevation of 98' and more than three of the FPS storm water pumps are in operation

Driver: 2 - Performance

Challenges: Meeting the collection system transport capacity during the construction

Describe Here the Changes from the 2018 CIP to 2019 CIP

2017 Construction expenses were only \$2.77 M, so the rest of the funds are moved to future years. The construction project from CS-120 will be initiated in 2019, so \$1M from 2021 is moved to year 2020. We anticipate a much higher construction cost and will be available only after the BOD workshop. Once it is available we will request more funding for future years up to 2022.

PROJECT INFORMATION

Scope of Work: Provide basis of design, and final design for a complete rehabilitation for the station with an emergency bypass option. Provide construction of the emerging project and construction assistance during construction.

Project History: The Northeast Sewage Pumping Station was built under contract PC-216. It had only three sanitary pumps and another sewage pump was added under PC-736. Later on OMID added 2 more sewage pumps. Recently under OMID Contract-3,OMID performed the removal of existing discharge piping; installation of a new discharge pipe manifold system; structural alterations to accommodate filling the east and west sides of the existing discharge chamber to support deteriorated external walls, replacement of the NESPS roof structure over the east and west sides; placement of new concrete walls and beams to form a centralized discharge opening to the PCI-4 sewer, construction of precast concrete walls above the central chamber and precast roof slab panels for permanent access; and other associated work to accomplish the repairs etc. This proposed rehabilitation project is to address the rest of the issues affecting the station which was built in 1969

Describe Here the Changes from the 2018 CIP to 2019 CIP

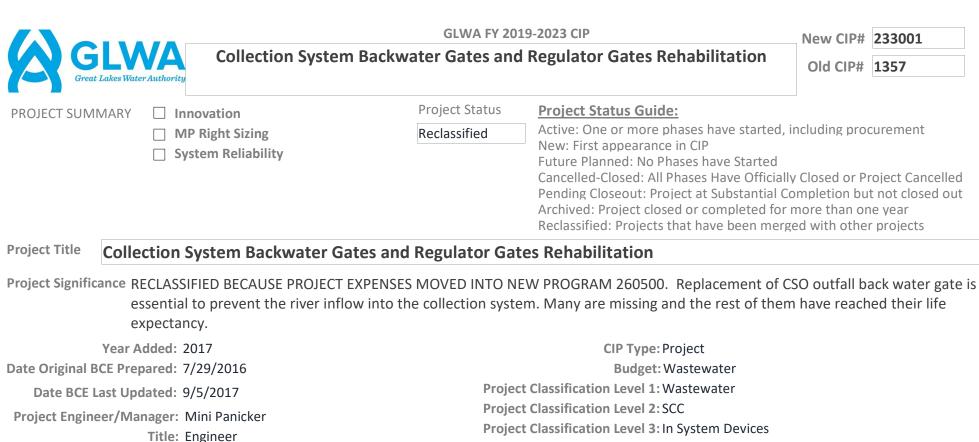

Old CIP# 1331

This project may not be initiated in 2017 due to the ownership transfer. Pushed all projected expenses back one year. Did not make any changes to the existing BCE.

CIP Version	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24 and Beyond	Total

2019			0	0	0	2,408	10,920	13,000	0	26,328

CIP 233001: Collection System Backwater Gates and Regulator Gates Rehabilitation

Phone: (313) 267-8996 Email: Mini.Panicker@glwater.org Manager: Biren Saparia Managing Dept SCC

Project Location: Multiple Counties Fund: 5421 Cost Center: 892211

PROJECT INFORMATION

- Scope of Work: Replacement of CSO outfall back water gate is essential to prevent the river inflow into the collection system. Many are missing and the rest of them have reached their life expectancy. X Locate the CSO Outfall back water gates, evaluate the existing conditions, and provide the necessary replacement / rehabilitation to minimize the river flow into the collection system. X The installation of these structures are dated back to 1912 under various contracts. All back water gates were replaced in the late seventies and again 6 were replaced in the recent years under PC-698. Existing ones are past their service life. X Some outfalls are below the river elevation; installation may be challenging.
- Project History: The installation of these structures are dated back to 1912 under various contracts. All back water gates were replaced in the late seventies and again 6 were replaced in the recent years under PC-698. Existing ones are past their service life.

Driver: 1 - Condition

Challenges: Some outfalls are below the river elevation; installation may be challenging.

Collection System In System Storage Devices (ISDs) Improvement

Old CIP# 1391

PROJECT SUN	IMARY Imnovation MP Right Sizing System Reliability	Project Status Future Planned	 Project Status Guide: Active: One or more phases have started, including procurement New: First appearance in CIP Future Planned: No Phases have Started Cancelled-Closed: All Phases Have Officially Closed or Project Cancelled Pending Closeout: Project at Substantial Completion but not closed out Archived: Project closed or completed for more than one year Reclassified: Projects that have been merged with other projects
Project Title	Collection System In System Storage D	Devices (ISDs) Im	provement
Project Signifi	cance ISDs are operational elements in the coll	ection system that h	help in storing combined sewage during wet weather events to

ect Significance ISDs are operational elements in the collection system that help in storing combined sewage during wet weather events to minimize the frequency and volume of the untreated overflows and to maximize the flows to the wastewater treatment plant and CSO control facilities.

Year Added:	2017	CIP Type: Project
Date Original BCE Prepared:	7/28/2016	Budget: Wastewater
Date BCE Last Updated:	9/5/2017	Project Classification Level 1: Wastewater
Project Engineer/Manager:	Mini Panicker	Project Classification Level 2: SCC
	Engineer	Project Classification Level 3: In System Devices
	(313) 267-8996	Project Location: Multiple Counties
Email:	Mini.Panicker@glwater.org	Fund: 5421
Manager:	Biren Saparia	Cost Center: 892211
Managing Dept	SCC	

PROJECT INFORMATION

Scope of Work: Assess the existing conditions of the ISD elements and their structures and rehabilitate/ replace.

Project History: 13 ISDs were installed in the GLWA combined sewers in 2003 under PC-747. No major rehabilitation has been done since then.

Driver: 1 - Condition

Challenges: These are operational elements, so flow control may be a challenge especially during wet weather periods.

 Other Important Info:
 *Innovation note: May need to increase scope for dynamic control of in-line elements -- see U of M study.

Project Location: Multiple Counties Fund: 5421 Cost Center: 892211

PROJECT INFORMATION

Managing Dept WW Eng

Scope of Work: Upgrade Ovation software and miscellaneous hardware. An evaluation for the upgrade will be conducted. During the evaluation of the upgrade, the study will also consider an evaluation of Ovation's ultimate ability to meet GLWA's future needs. Replace Obsolete/End of Life Allen Bradley PLC5 control systems at 3 CSO Facilities (Leib, St. Aubin, 7-Mile) and upgrade critical Instrumentation. New Controllers, HMI, network components and controls system integration. Upgrade Ovation at 4 CSO Site(Connor, Oakwood, Baby Creek and Belle Isle) and Upgrade critical Instrumentation. Implement high performance graphics and advance alarm management and advanced process control. Upgrade control rooms at WRRF and CSO Sites. New consoles, HVAC, Flooring, security enhancements and lighting.

Project History: GLWA is using an Ovation Control System. Ovation System utilizes Microsoft Windows based operating system. Anytime when Microsoft stops supporting an operating system, Ovation upgrades its software and miscellaneous hardware in order to be compatible with new windows based operating system. GLWA business practice has been not to upgrade ovation immediately and wait few years to upgrade.

Driver: 4 - 0&M Challenges: Co-ordinate with Plant and CSO operation for shutdown requests during the software and hardware upgrade.

Other Important Info: *Innovation note: Maximize automation, especially aeration decks -- see University of Michigan phosphorus study.

Related Project: Last upgrade was completed in 2014.

PROJECT INFORMATION

- Scope of Work: This is an allowance for unplanned critical projects, equipment replacement/rehabilitation, critical asset replacement, energy saving projects, etc.. at the Wastewater Treatment Plant and other Wastewater Operation Facilities. Unplanned critical items include, but not limited to, mechanical, HVAC, electrical, instrumentation and control, demolition, earthwork, concrete, masonry, etc.
- Project History: WRRF has audited twice in the past for all equipment and supporting facilities. These audits helped to assess equipment repair and future planning and execution of rehabilitation/replacement projects at WRRF facilities.

Driver: N/A - Allowance

Challenges: N/A - Allowance

Other Important Info:

Related Project: At present 2 capital projects has been identified to be tapped for CIP#1257 budget: (a) SCP-PC-014, Plant wide Replacement of Emergency Lighting and Exist Signs. The construction budget for this projects is \$1,178,743. The NTP was issued on 12/2/2016 and the Final Completion Date is 12/27/2017. (b) SCP-PC-016G, Replacement of Flow Meter at Neff Road Pumping Station. This project has recently been completed in March 2017.

WRRF, Lift Station and Wastewater Collection System Structures Allowance

Old CIP# 1257

CS -060 is also funded from this Allowance because it was started as an emergency due to the fire in Complex II of WRRF.

Manager: Biren Saparia

PROJECT INFORMATION

Scope of Work: Provide CCTV and or sonar inspection of the GLWA Collection System Interceptors and Trunk Sewers to reveal the existing conditions as per the National Association of Sewer Service Companies' (NASSCO) Pipeline Assessment Certification Program (PACP) standards, evaluate the existing conditions, and provide the necessary cleaning/rehabilitation/replace to optimize the design capacity of the collection system and to minimize the inflow and infiltration into the collection system.

Project History: The installation of some of these interceptors and sewers are dated back to 1912 under various contracts.

Detroit River Interceptor inspection was recently completed in 5 different phases and there were portions deteriorated with visible surface aggregates, attached encrustation and infiltration. Some trunk sewer inspection revealed sludge deposition with reduced transportation capacity. Inspections of sewers to reveal the existing conditions are necessary and shall be done every 5 to 7 years. Recommendations from these inspections may reveal further need for cleaning, rehabilitation or replacement.

Cost Center: 882301

Driver: 1 - Condition

Old CIP# 1263

Challenges: Large sewers and interceptors may have flow control challenges for both inspection and rehabilitation.

Other Important Info: n/a

PROJECT INFORMATION

Scope of Work: Replace the existing antiquated metering equipment with new metering equipment.

Project History: The GLWA sewer metering equipment is composed of various types of metering technology, including Magnetic Flow Tube, Partial Flume, Ultrasonic, Venturi, and Sonic Hydro ranger. Most of these meters have surpassed their life expectancy for accurate metering, and need to be replaced with new metering technology.

2 - Performance Driver:

Challenges: Requires temporary shutdown of large sewers

CIP 260500: CSO Outfalls Rehabilitation

GLV Great Lakes Wate			GLWA FY 2019-2023 CIP CSO Outfall Rehabilitation			
PROJECT SUMMARY	 Innovation MP Right Sizing System Reliability 	Project Status Future Planned	Project Status Guide: Active: One or more phases have started, i New: First appearance in CIP Future Planned: No Phases have Started Cancelled-Closed: All Phases Have Officially Pending Closeout: Project at Substantial Co Archived: Project closed or completed for p Reclassified: Projects that have been merg	Closed or Prompletion bu	oject Cancelled t not closed out e year	

Project Significance PROJECTS 222006 AND 233001 HAVE BEEN INCORPORATED INTO THIS PROJECT. Rehabilitation of the CSO outfalls is essential to properly discharge the uncontrollable combined sewer overflows to the receiving waters and to prevent sewer back up into the Conveyance System. Recent inspections of the outfalls revealed structural deficiencies like fractures, missing mortar from bricks etc. There are sediment and debris deposits in many of them.

Year Added:	2017	CIP Type: Project

PROJECT INFORMATION

Scope of Work: Preliminary Scope of Work of the project is construction. Contract CS-168 will review the existing records, evaluate the existing conditions, and provide the necessary design to rehabilitate the outfalls.

Project History: The construction of these outfalls are dated back to the early 1900s under various contracts.

Driver: 2 - Performance

Challenges: Some outfalls are below the river elevation; rehabilitation may be challenging.

Other Important Info: PROJECTS 222006 AND 233001 HAVE BEEN INCORPORATED INTO THIS PROJECT.

Related Project: CIP 1357, CS-168

Describe Here the Changes from the 2018 CIP to 2019 CIP

Previous projected expenses from the 2018-2022 CIP for project 222006 are already included in the 2018 values below. An additional \$7,197 was moved from CIP 222005 into this program and \$9,301 moved from CIP 233001 into this ongoing program. This accounts for the perceived increase of \$16,498. In summary, all three projects (222005, 222006 & 233001) are now included in the Program and projected expenditures have remained the same.

PROJECT INFORMATION

Scope of Work: This program is intended to include studies, design, construction administration, and construction projects which serve to improve process areas or functions of the CSO Facilities. The overall scope of this program is to complete the following: Needs Assessment, Condition Assessment, and update to the 2013 Scheduled Replacement Plan (SRP); Replacement of CSO Facilities Fire Alarm Systems; Structural Condition Assessment Design/Build project; and flushing improvements to Baby Creek CSO Facility. A direct product of the Needs/Condition Assessment and SRP is identification of facility needs with projects identified, prioritized, and conceptual cost estimates. From this output, RFP's will be developed to address these needs. For this purpose, Design and Construction dollars have been identified in the later years of this Program to facilitate design and construction of those identified needs. It is anticipated that the primary drivers of these improvements will be obsolescence/end of service life, excessive O&M problems, reliability, efficiency and system standardization which arise from feedback from operation & maintenance, the scheduled replacement plan, and the needs/condition assessment. Following completion of the Wastewater Master Plan, new projects may be otherwise defined which will be incorporated into the CIP. These projects will likely be entered into the CIP as stand-alone projects rather than falling under this program. Furthermore, upon completion of the NPDES permit, new regulatory requirements may arise which require capital improvements. Depending on the nature of those improvements, they may be stand-alone projects or fall within the elements of this Program.

CSO FACILITIES IMPROVEMENT PROGRAM

Old CIP# 1384

Project History: The GLWA CSO Control Program consists of the operations of 6 CSO RTB's, and 3 Screening & Disinfection Facilities (SDF). The fundamental difference between the SDF's and the RTB's is the presence of a bonafied basin versus a large diameter, long effluent pipe/ outfall. The long outfall (SDF) functionally serves a purpose similar to the basin (RTB) in terms of storage of combined sewer overflow during a rain event. As a result, the SDF's are fundamentally more difficult to keep clean than the RTB's because flushing systems must transport settled solids (after a storm) long distances to leave the effluent pipe. The CSO Facilities average age is around 15 years with the oldest facilities being constructed in 1994 and the most recent facility being constructed in 2011. A scheduled replacement plan was completed in 2013, which is now out of date, and a high level Needs Assessment conducted in 2016, which didn't identify large scale projects or priorities based on condition other than those of emergency nature. Projects resulting from the 2016 NA were largely emergency projects in nature. A Goal of this program includes standardization of the systems utilized at each facility, as well as improving operational & maintenance conditions at each facility. Given the eras in which the facilities were constructed, and being part of demonstration projects, they have differing technology which makes maintenance and operations duties more difficult. Another goal of this program is to improve the operating conditions of facility assets to increase reliability, efficiency, and compliance with all GLWA regulatory and other levels of service.

Driver: Varies

Challenges: As this program starts off, there is a lot of design RFPs in the beginning which will lead to la refined projects aimed at improving operations, which lead to RFPs for design and large scale construction projects in the later years (3-5). A significant challenge to be faced will be maintaining the CSO facilities in current operations without the benefit of large-scale improvements of the CSO Systems. Another significant challenge of this program will be unforseen conditions that may be encountered as facility inspections & condition assessments begin. For example, finding significant structural distress of a basin could lead to increase of budget or extension of timeline of improvements. Considering much of the equipment/systems identified for inclusion in this program are at or near obsolescence or are actively causing O&M issues, delays in improvements could possibly cause operational or compliance issues.

Other Important Info: (Replaces CIP1313).

Related Project: The proposed new CIP budget for rehabilitation for all the CSO RTB and SDF facilities is based on the 2016 Needs Assessment Study Report and condition assessment performed under CS-1499, Task 18. The condition assessment identified deficient process equipment, systems and deteriorating structural conditions that required near-term remedial work at the three RTB's: the Puritan-Fenkell Basin and dry weather pump station (completed in 1998 under PC-697), the Seven Mile (Completed in 1999 under PC-696) and the Conner Creek (completed in 2005 under PC-739). The 2016 Needs Assessment Facility walkthrough have identified that CSO RTB and SDF's at Hubbell Southfield, St. Aubin & Leib, Baby Creek and Bell Isle needs rehabilitation. The Puritan-Fenkell and Seven Mile RTB's will be combined with this new capital improvements plan for all the remaining CSO facilities. GLWA staff have identified that Conner Creek CSO facility rehabilitation is critical to the wastewater operation and few projects has initiated as an emergency repair work. Due to recent rain events under emergency repair activities the following scope items at GLWA's Conner Creek CSO RTB are ongoing; Install additional automation, continue repairs to existing automation, replace five sodium hypochlorite pumps, repair piping leaks and relocate piping for the flushing water system, replace 5 Accusonic meters upstream, replace electrical power and controls raceway above the RTB, replace emergency relief gates causing concrete damage, replace all disinfection valves, replace all insulation and heat taping for exposed sodium hypochlorite lines, replace all sodium hypochlorite mixers in the channels. The above Conner Creek CSO RTB facility emergency repair list include only operation critical rehabilitation needs to avoid flooding's, the remaining non critical rehabilitation needs identified in the Needs Assessment Report will be addressed through this proposed project at this facility.

Describe Here the Changes from the 2018 CIP to 2019 CIP

Costs for FY 2019 construction have increased due to the emergency nature of the required projects at the Conner Creek CSO Facility and to facilitate design and construction of new alarm systems for 8 of the CSO Facilities (excepting Oakwood - minor repairs) because those systems are not functional, or long since obsolete at this time requiring a lot of maintenance to stay in service. For FY20-FY22, the 2018 CIP identified various unallocated dollars in the CIP; however, no specific projects or improvements were not identified and subsequent RFPs to begin those projects were not developed. Therefore, the expected costs for those FY's has decreased to allow time over the next year or so to complete a full-scale Condition Assessment, Needs Assessment, and Update of the 2013 Scheduled Replacement Plan. Projects resulting out of the NA, CA, and SRP are expected to begin hitting the CIP construction dollars beginning in FY23. This allows time for RFP and RFB procurement periods as well as development of RFPs and subsequent design phases of a typical project. There are also anticipated improvements for structural condition assessment anticipated to occur over the next 2 Fys as a design/build project, and improvements to the Baby Creek Facility largely expected to be designed in FY 20 and FY21 and constructed in FY 22 and FY23. The time between allows for scope development, RFP, design, and RFB phases of a project before it begins construction. As other items such as the Master Plan and NPDES Permit come to, new projects will be identified aimed at achieving regulatory or other goals identified, which will ultimately affect CIP dollars later in the defined CIP period. During the time of completing a thorough condition assessment/needs assessment document for proper planning and execution of capital improvements, other emergent projects may arise as identified under the challenges section of this BCE.

CIP Version	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24 and Beyond	Total
