PUBLIC COMMENT GLWA Board Meeting at Focus  
Hope 6 P.M. September 26, 2018  
please enter this into your minutes; thank you

The Cost of water keeps increasing, but the quality of our water does not. Healthy water is important for people's health. My mother as a daughter of a doctor knew all too well, used to school me with this adage : "health is our most important wealth; without health , it is hard to be happy, regardless of any monetary wealth.

To have healthy water, GLWA needs to install carbon filtration at our water intakes; the carbon filtration will not only remove lead but will also remove heavy metals and chlorinated hydrocarbons.

Lead, other heavy metals and chlorinated hydrocarbons in the children's school water is not healthy for the children to drink; but what about these poisons they drink in their residences? And what about US, who are no longer children...who also drink this water in our residences? Kroger sell gallons of purified water in their grocery stores; it comes from a municipal source; In Cincinnati where Krogers is headquartered, both their intake water and the water leaving their sewage treatment plant to go back into the river are put thru carbon filtration. Detroit used to have carbon filtration, and we sorely need it again.
